

no-referrer	No referrer header is sent, meaning that no referrer information is sent.
no-referrer-when-downgrade	The default behavior: origin, path, and querystring of the URL are sent as a referrer when the protocol security keeps the same or improves, but not when it decreases.
strict-origin	Only send the origin of the document as the referrer header, if the protocol security stays the same. Don't send it to a less secure destination.
strict-origin-when-cross-origin	Send the origin, path, and querystring for a same-origin request, but only the origin when on a cross-origin request. So this is only "strict" when making a cross origin request. Only send when the protocol security does not change. Like other headers, does not apply for decreasing protocol security.
same-origin	A referrer is sent for same-origin, but for cross origin nothing is sent.
origin	Only send the origin as the referrer, always.
origin-when-cross-origin	Send the origin, path, and query when on same-origin, but only send the origin when performing cross-origin requests.
unsafe-url	Always send the origin, path, and query string on any request.
